

Field Report - Bridge collapse, Northern Reach (incoming)

Date: 2026-05-30

Filed by: Mobile assessment team, Northern Reach corridor

A footbridge on the main access route into the Northern Reach settlement collapsed after heavy rain, cutting off roughly forty households from the distribution point. The team reached the cut-off cluster on foot to carry out a rapid assessment.

Key findings:

- Protection concern: three unaccompanied adolescents were found sheltering together without an adult caregiver on record. They need a child-protection referral and an urgent follow-up visit before the next aid cycle.
- Two households include members with chronic conditions who have now missed a scheduled medication delivery because the route is impassable.
- Drinking water is being collected from an unprotected source; a water-quality check is recommended.

Recommended actions:

1. Prioritise a temporary crossing or an alternative delivery route so the cut-off cluster is not skipped in the next distribution.
2. Open a child-protection case for the three adolescents and arrange the urgent follow-up visit.
3. Add the chronic-condition households to the next mobile-clinic run.
